

Author

Name: Bala Murugan

Roll number: 21f1005885

Student email: 21f1005885@student.onlinedegree.iitm.ac.in

About me: I'm a mechanical engineer. Now I'm doing this course as a full time along with an internship in data analytics.

Description

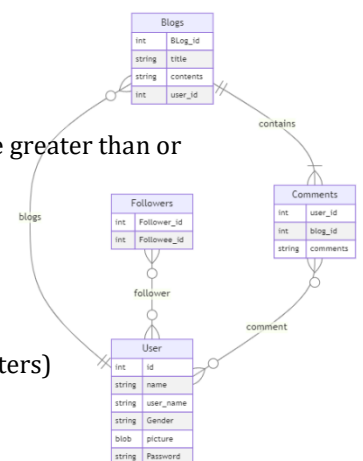

BLOG LITE- is a web application which is more similar to other social media platforms like Facebook, Insta. It's a multiuser web application. By creating an account on this, users can add new blogs and multiple blogs and follow other users on this platform. The user who follows each post can be liked or commented on.

Technologies used

- **Libraries:**
 - **Flask** – To handling the backend
 - **Flask SQL alchemy** – To create models and querying the database
 - **Flask login** – To ensure login security
 - **Base64** – To handling encode and decode.
 - **Flask restfull** – To create api and it's functionalities.
 - Some other basic libraries like **OS, IO** to handling the paths.
- **Basic Endpoints:**
 - **/** - Home page of the website.
 - **/registration** – User registration page. By providing a basic information about the user they can create a account on this page.
 - **/user/home** – User's home page. Here they can see all the posts from users they are following.
 - **/user/profile** - All the details about the user.
 - **/user/followers** – List of followers for the user
 - **User/following** – List users followed by the current user.

DB Schema Design

- **User**
 - **First name** – User's first name (Required)

 - **User_id** – User who created the post(required)
- **Followers**
 - **Follower** – the user who follow (Required and Primary Key)

- **Following** – The user who following (Required and Primary Key)
- **Comments:**
 - **Blog_id** – Blog's Id in which the comments added (Required)
 - **Comments** – All the comments for that blog (Nullable)

API Design

- **Basic routes:**
 - **User**
 - **Get:** /api/user/{user_name} – to get the user information
 - **Put:** /api/user/{user_name} – To modify the user details.
 - **Delete:** /api/user/{user_name} – To remove user from the database
 - **Post:** /api/user – To add new user to the database.
 - **Blogs**
 - **Get:** /api/post/{id } – to get the post information
 - **Put:** /api/post/{id } – To modify the post details.
 - **Delete:** /api/post/{id } – To remove post from the database
 - **Post:** /api/post – To add new post to the database.
 - **Action**
 - **Post:** /api/follow/{user_name} – To add new follower in the database
 - **Delete:** /api/unfollow/{user_name}{follower_name} – To remove a follower from the database.
 - **Get:** /api/all_post/{user_name} – To fetch all the posts related a user.

Architecture and Features

Every user page has a side and top navigation bar. In the top navigation bar, there will be a search box and a Logout button. In the side navigation bar users can navigate easily to other functionalities like seeing their profile information and followers/following details.

The side navigation bar has a Create post button where users can create posts by providing the Title and content of the post (Image- if required).

At the top of the User home page quick create dialog box has been provided.

Following are some actions users can do on the application.

- Users are able to set the privacy for the post they create.
- Users can follow other users by simply searching the First name or Last name or User name of the user.
- User can add multiple comments for a single blog.
- Users are allowed to see other users' blogs only if they follow them.
- Users can like other user Blogs
- Users can edit the blog title or content or image that they created.
- Users are allowed to remove the blogs if they are the author of that blog.
